It is not known why this is done, but it is said to be for the purpose of keeping the fish from escaping. The fisherman then proceeds to fish, using a net or a line with bait. The net is thrown into the water, and the fish swim up to it, causing it to fill with water. The fisherman then pulls the net to shore, capturing the fish. This process is repeated as needed, and the fish are then taken to be sold or kept for personal use. The act of fishing is often seen as a way to connect with nature and the environment, as well as a means of providing food.
